WMC

## Markov Random Field

# Weighted Model Counting (WMC)

- ▶ Generalises propositional model counting ( $\#SAT$ )
- ▶ Applications:
  - ▶ graphical models
  - ▶ probabilistic programming
  - ▶ neural-symbolic artificial intelligence
- ▶ Main types of algorithms:
  - ▶ using knowledge compilation
  - ▶ using a SAT solver
  - ▶ manipulating pseudo-Boolean functions

## Example

$$w(x) = 0.3, w(\neg x) = 0.7, \\ w(y) = 0.2, w(\neg y) = 0.8$$

$$WMC(x \vee y) = w(x)w(y) + \\ w(x)w(\neg y) + w(\neg x)w(y) = 0.44$$

# WMC, Formally

## Definition

A **WMC instance** is a tuple  $(\phi, X_I, X_P, w)$ , where

- ▶  $X_I$  is the set of **indicator variables**,
- ▶  $X_P$  is the set of **parameter variables** (with  $X_I \cap X_P = \emptyset$ ),
- ▶  $\phi$  is a propositional formula in CNF over  $X_I \cup X_P$ ,
- ▶  $w: X_I \cup X_P \cup \{\neg x \mid x \in X_I \cup X_P\} \rightarrow \mathbb{R}$  is a **weight function**
  - ▶ such that  $w(x) = w(\neg x) = 1$  for all  $x \in X_I$ .

# A More Expressive Alternative

## Definition (Pseudo-Boolean Projection (PBP))

A **PBP instance** is a tuple  $(F, X, \omega)$ , where  $X$  is the set of variables,  $F$  is a set of two-valued pseudo-Boolean functions  $2^X \rightarrow \mathbb{R}$ , and  $\omega \in \mathbb{R}$  is the scaling factor.

For any propositional formula  $\phi$  over a set of variables  $X$  and  $p, q \in \mathbb{R}$ , let  $[\phi]_q^p: 2^X \rightarrow \mathbb{R}$  be the pseudo-Boolean function defined as

$$[\phi]_q^p(Y) := \begin{cases} p & \text{if } Y \models \phi \\ q & \text{otherwise} \end{cases}$$

for any  $Y \subseteq X$ .

# From WMC to PBP

## Example

- ▶ Indicator variable:  $x$
- ▶ Parameter variables:  $p, q$
- ▶ Weights:  $w(p) = 0.2$ ,  $w(q) = 0.8$ , and  $w(\neg p) = w(\neg q) = 1$

---

### WMC Clause

---

$$\neg x \Rightarrow p$$

$$p \Rightarrow \neg x$$

$$x \Rightarrow q$$

$$q \Rightarrow x$$

$$\neg x$$

---

# From WMC to PBP

## Example

- ▶ Indicator variable:  $x$
- ▶ Parameter variables:  $p, q$
- ▶ Weights:  $w(p) = 0.2$ ,  $w(q) = 0.8$ , and  $w(\neg p) = w(\neg q) = 1$

WMC Clause	In CNF
$\neg x \Rightarrow p$	$x \vee p$
$p \Rightarrow \neg x$	$\neg x \vee \neg p$
$x \Rightarrow q$	$\neg x \vee q$
$q \Rightarrow x$	$x \vee \neg q$
$\neg x$	$\neg x$

# From WMC to PBP

## Example

- ▶ Indicator variable:  $x$
- ▶ Parameter variables:  $p, q$
- ▶ Weights:  $w(p) = 0.2$ ,  $w(q) = 0.8$ , and  $w(\neg p) = w(\neg q) = 1$

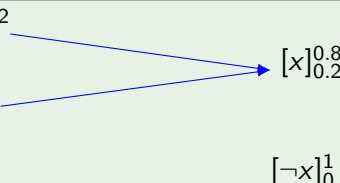

WMC Clause	In CNF	Pseudo-Boolean Function
$\neg x \Rightarrow p$	$x \vee p$	$[\neg x]_1^{0.2}$
$p \Rightarrow \neg x$	$\neg x \vee \neg p$	
$x \Rightarrow q$	$\neg x \vee q$	$[x]_1^{0.8}$
$q \Rightarrow x$	$x \vee \neg q$	
$\neg x$	$\neg x$	$[\neg x]_0^1$

# From WMC to PBP

## Example

- ▶ Indicator variable:  $x$
- ▶ Parameter variables:  $p, q$
- ▶ Weights:  $w(p) = 0.2$ ,  $w(q) = 0.8$ , and  $w(\neg p) = w(\neg q) = 1$

WMC Clause	In CNF	Pseudo-Boolean Function
$\neg x \Rightarrow p$	$x \vee p$	$[\neg x]_1^{0.2}$
$p \Rightarrow \neg x$	$\neg x \vee \neg p$	
$x \Rightarrow q$	$\neg x \vee q$	$[x]_1^{0.8}$
$q \Rightarrow x$	$x \vee \neg q$	
$\neg x$	$\neg x$	$[\neg x]_0^1$

# Outline

A More Expressive Alternative

When Does This Transformation Work?

How Good Is It?

Summary and Future Work

## Correctness Conditions (1/2)

For each parameter variable  $p \in X_P$ ,

- ▶  $w(\neg p) = 1$ ,
- ▶ and the set of clauses that mention  $p$  or  $\neg p$  is

$$\left\{ p \vee \bigvee_{i=1}^n \neg l_i \right\} \cup \{ l_i \vee \neg p \mid i = 1, \dots, n \}$$

for some non-empty family of **indicator** literals  $(l_i)_{i=1}^n$ .

In other words,  $p$  is defined to be equivalent to  $\bigwedge_{i=1}^n l_i$ .

## Correctness Conditions (2/2)

For each parameter variable  $p \in X_P$ ,

- ▶  $w(p) + w(\neg p) = 1$ ,
- ▶ each clause has at most one parameter variable,
- ▶ there are no negative parameter literals,
- ▶ if  $\{p\} \in \phi$ , then this is the only clause that mentions  $p$ ,
- ▶ and for any two clauses of the form  $\chi \Rightarrow p$  and  $\psi \Rightarrow p$ ,  
 $\chi \wedge \psi \equiv \perp$ .

A More Expressive Alternative

When Does This Transformation Work?

How Good Is It?

Summary and Future Work

## Summary and Future Work

- ▶ PBP is a more expressive alternative to WMC that works with state-of-the-art WMC algorithms based on pseudo-Boolean function manipulation.
- ▶ Many WMC encodings can be efficiently transformed into PBP while removing unnecessary variables and clauses.
- ▶ The identified conditions for this transformation to work help explain how WMC encodings for Bayesian networks operate.
- ▶ Performance improvements depend on the encoding.
  - ▶ The very first encoding was virtually unaffected,
  - ▶ whereas the state-of-the-art encoding was significantly improved.
- ▶ Can the identified conditions be generalised further?
- ▶ Can the transformation be applied to WMC encodings for other application domains?
